14. Abstract

We have learned to manipulate defects, domains, crystallinity, desorption, exchange, insertion, grafting, conductance, and deposition to advantage in order to manipulate film structures and properties and to isolate molecules for use, study, and/or reaction.

We have enhanced our abilities to measure with sub-nanometer resolution across a broad spectral range. We have discovered unique opportunities at this scale, such as "optically hot" asperities on asymmetric nanoparticles. We expect to be able to exploit these effects to advantage. There are no other means of studying such materials at these scales.

Couplings between molecules and nanoparticles that we propose to study may pose fundamental limitations on the densities to which functional devices can be packed.

We have demonstrated our ability to discriminate between different nanostructure compositions. We have proposed using this capability to develop selective "stains" for scanning probe microscopy in analogy to those employed in conventional light microscopy. The difference here is that much higher spatial resolution will be possible so that single exposed functional groups may be labeled.

Kamna, T. M. Graham, and P. S. Weiss, submitted for publication.

TR 30. *The Effects of Steps and Substrate-Mediated Interactions on Langmuir-Hinshelwood Reaction Rates*, E. N. Schulman and P. S. Weiss, submitted for publication.

TR 58. *Local Electronic Structural Effects and Measurements on the Adsorption of Benzene of Ag{110}*, J. I. Pascual, J. J. Jackiw, K. F. Kelly, H. Conrad, H.-P. Rust, and P. S. Weiss, submitted for publication.

Note that a number of other manuscripts based on ONR-supported work are in preparation on self-assembly, directed assembly, nanoparticle assemblies and spectroscopy, and functional molecules.

b. *Papers published in refereed journals:*

TR 28. *Surface Characterization*, G. E. McGuire,* P. S. Weiss, J. G. Kushmerick, J. A. Johnson, S. J. Simko, R. J. Nemanich, N. R. Parikh, and D. R. Chopra, *Analytical Chemistry* **69**, 231R (1997).

Jamie J. Arnold
Eberly College of Science Roberts Award.

Aimee L. Bross
Eberly College of Science John and Elizabeth Teas Scholarship.
American Chemical Society, Analytical Chemistry Division, I. M. Kolthoff Undergraduate Research Award.
American Physical Society, Chemical Physics Division, Graduate Student Travel Award.

Michael T. Cygan
National Research Council Post-doctoral Fellowship (for the Naval Research Laboratory)

Terrence G. D'Onofrio
Roberts Graduate Research Award

James H. Ferris
Dorothy M. Hoffman Vacuum Education Award, 2nd Prize.

Marilyn M. Kamna
Eberly College of Science Roberts Award.

James G. Kushmerick
Twelfth Graduate Research Exhibition, Honorable Mention.
Braddock Graduate Fellowship of the Eberly College of Science.

Greg S. McCarty
American Vacuum Society, Nanometer Science and Technology Division Travel Award.
Lubrizol Graduate Research Award, 1999

Elizabeth Muth
Eberly College of Science John and Elizabeth Teas Scholarship.

Stephan J. Stranick
Ithaca College Young Alumnus of the Year.

Roger Wang
College of Engineering H. Thomas and Dorothy Willits Hallowell Scholarship.
The Pennsylvania State University Presidential Freshman Award.

Paul S. Weiss
Guest Editor for Special Issue of *Israel Journal of Chemistry*.

- John Simon Guggenheim Memorial Fellowship.
Visiting Professor, Department of Molecular Biotechnology, University of Washington.
- National Science Foundation Special Creativity Award.
Visiting Professor, Department of Electronic Science and Engineering and the Venture Business Laboratory, Kyoto University.
- Elected Fellow, American Association for the Advancement of Science.

Final Report - PART II

- c. *Cognizant ONR Program Officer*
Dr. John C. Pazik
- d. *Program objective*

The objective of this program was to examine the electronic and physico-chemical properties, the stability, and the dynamics of nanometer-scale structures and of components that may be used in such structures. These structures and components may play key roles in evolving or even revolutionizing devices for communications, sensors, and detectors. Our understanding of these structures is developed using unique scanning tunneling microscopy instrumentation which gives us the ability to work at low temperatures, to manipulate surface structures, and to probe both electronically and over a broad frequency range. We collaborate with key developers of molecules, films, and devices to screen and to advance the properties of the components, structures, and films they create. This work serves as the scientific backbone of the technological advances in related DARPA Moletronics work and in a wide range of other areas.

- e. *Most significant results*

We have learned to manipulate defects, domains, crystallinity, desorption, exchange, insertion, grafting, conductance, and deposition to advantage in order to manipulate film structures and properties and to isolate molecules for use, study, and/or reaction.¹⁻⁸ We have used scanning tunneling microscopy, X-ray photoelectron spectroscopy, and infrared spectroscopy to measure the resultant films.

We have enhanced our abilities to measure with sub-nanometer resolution across a broad spectral range.⁸⁻¹¹ We have discovered unique opportunities at this scale, such as "optically hot" asperities on asymmetric nanoparticles. We expect to be able to exploit these effects to advantage. There are no other means of studying such materials at these scales. Couplings between molecules and nanoparticles that we propose to study may pose fundamental limitations on the densities to which functional devices can be packed.

We have demonstrated our ability to discriminate between different nanostructure

compositions. We have proposed using this capability to develop selective "stains" for scanning probe microscopy in analogy to those employed in conventional light microscopy.^{9,10} The difference here is that much higher spatial resolution will be possible so that single exposed functional groups may be labeled.

Specific accomplishments relating to the above are:

Selecting the separation or mixing of components at the nanometer scale.^{4,7} In addition, we can graft one film onto another in two dimensions. This enables selective decoration or reaction of unique surface sites at an interface that is physically perfect, but chemically distinct from the rest of the surface.^{4,7}

Selective removal of specific defects by processing films and controlling their completeness.^{1,4,7} This leads to independent control of insertion, exchange, and removal of molecules.

Insertion of single molecules for subsequent study or reaction.^{3,8,11} These molecules can then be probed individually or in bundles.^{8,11} Recent (unpublished) experiments allow us to follow electronic switching of inserted molecules. This isolation also enabled the first example of the selective chemical modification of surface species without disrupting the nanometer-scale structure.³ A living polymer was grown off inserted, isolated tethers. It was also possible to bundle together the tethers so as to select growth of surface-bound polymer brushes. These polymers and the controlled substrate on which they lie may be used to create non-volatile nanometer-scale organic memory.²

We have observed "optically hot" regions on single nanoparticles.^{9,10} These may be used to enhance spectroscopy, optical coupling at the nanometer scale, or isolation at this scale. We have also shown that nanoparticles couple electronically as they are brought into proximity, but remain out of chemical contact (not yet published). We have created a unique system for studying these interactions that does not depend on bulk synthesis and laborious separations. This will allow us to explore the phase space of these interactions and their dependence on separation and orientation, before targeting selected assemblies for synthesis.

Our ONR Program has served as the core for discovery in our group, from which a large number of other efforts have emanated.

¹ *Directing Assembly in Monolayers by Controlling Exchange Kinetics*, A. L. Bross, A. E. Hooper, L. A. Bumm, D. L. Allara, and P. S. Weiss, to be submitted to *Journal of Physical Chemistry B*.
